

ARCHICAD PRODUCTIVITY TOOLS

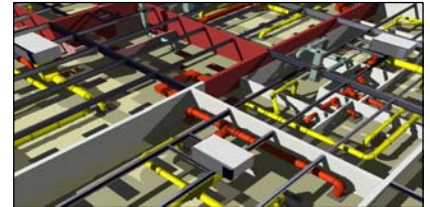

ArchiGlazing

ArchiGlazing enables architects to design a broad range of glass structures. Custom windows can be created based on sketches, and vertical or slanted glass walls can be built on any type of curves quickly and easily. It offers extra support for the placement of conical and shed glass structures as well as winter gardens. The parametric behavior of these objects enables changing most of their properties at any time in the design process. ArchiGlazing fulfills the needs of the ambitious architects, seeking to exceed the capabilities of the standard ArchiCAD library.

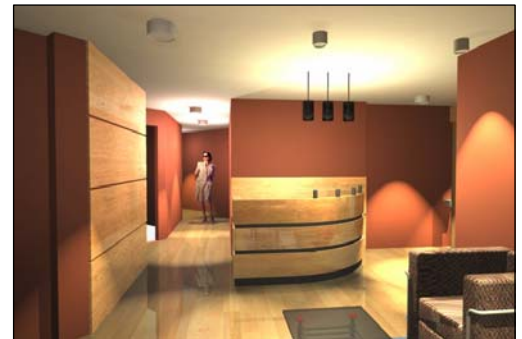

Ductwork

Ductwork provides tools for ArchiCAD users to model ductwork quickly and efficiently, without in-depth knowledge of HVAC. It makes placing ducts in ArchiCAD as easy as drawing a wall. Working with Ductwork you can plan, develop, visualize and document ductworks by integrating them into your ArchiCAD Virtual Building model. Ductwork's sophisticated automatic connection functions accelerate the modeling process.

Artlantis Renderer

Photo-Realistic Rendering and Animation at your fingertips. Its user friendliness, simplicity and efficiency, together with the astounding quality of its rendered images, reveal an unsurpassed technological achievement. With its powerful rendering engine Artlantis reaches an unprecedented level of speed performance and makes realism attainable by just a few mouse clicks.

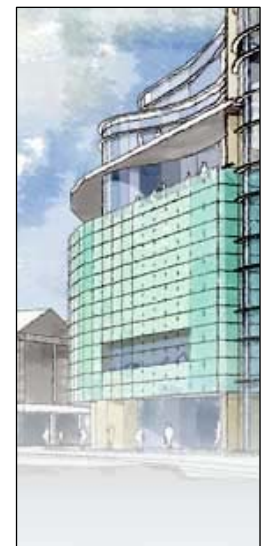

Piranesi – 3D Painting Tool

Piranesi is a specialized '3D painting' tool, allowing you to start with a simple rendering of a 3D model, and quickly develop it into high quality images ready for client presentations. You can use Piranesi to quickly develop photorealistic images, by painting in textures and scenery with automatic perspective and masking; or you can use Piranesi's wealth of effects to generate non-photorealistic images that have a more subtle, hand-rendered feel and focus the client's mind of what is important in the design. You can even use Piranesi with a 2D plan or elevation image, or to generate Panoramas!

SketchUp

Developed for the conceptual stages of design, SketchUp is powerful yet easy-to-learn 3D software. The software allows even the digitally challenged to design in three dimensions with the push of a button or the swipe of a mouse. This award-winning software combines a simple, yet robust tool-set that streamlines and simplifies 3D schematic design inside your computer.

ARCHICAD PRODUCTIVITY TOOLS

Option Manager

Until now, no 3D Virtual Building application has offered a real solution to manage **Design Options or Schemes** the way ArchiCAD does. In the past, every configuration had to be created and presented separately.

The ArchiCAD Option Manager makes it possible to **create and manage overlapping options or schemes**. Variations of the project can be shown with one click. When selecting the corresponding items from a list in a palette, the model changes accordingly. Hence, the computer coordinates design changes automatically and makes it easy to up-sell design options to the client with the help of 3D visualization.

Keynotes Manager

A complete system for creating, managing, applying and compiling keynotes on your drawings. Create keynote lists in Excel and use the built-in converter to create xml files for use in ArchiCAD. Specify keynotes for particular composite structures, and apply them automatically to create notated drawings.

Accessory Tools

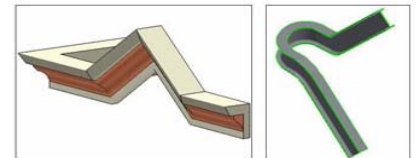

This collection of tools provides a wide range of accessories to help enhance the detail of your ArchiCAD Model. Automatically attach real objects to your primary elements of walls, slabs and roofs. It includes the following components:

- Wall Builder
- Foundation Builder and Pre-cast Slab Builder
- Roof Builder
- Column Footing

3D Profiler

The ultimate profiler tool to enable profiles (shapes) to be extruded through a number of points in free space. The profiles can be totally managed and edited via Profile Manager which is a part of the package. Many preset profiles are provided. Great for moldings, cornices, and fascia, all at multiple angles.

Framing Manager

Automatically creates fully dimensioned framing plans and 3D framing models for some or all of your walls. Framing also shows on the floor plan, and can be fully configured to meet all common standards. Individual wall junctions, stud or plate elements all are editable. Modifications to the framing show up on all drawings and in the 3D model. Framing schedules can be created and stay current with design changes
